What is a microinverter solar system?

Typically, microinverters are “distributed” inverters. Solar PV systems with microinverters have a small inverter installed for each individual solar panel. Instead of sending energy from every panel to a single inverter, microinverters convert the DC energy to AC energy on the roof itself.

Where are solar inverters located?

Microinverters are located on the roof near the solar panels, due to which these inverters are more efficient than string inverters when it comes to converting energy. Solar systems with microinverters can still generate electricity, even if one or two panels do not perform properly.

How long does a sunsynk battery last?

Adding a Sunsynk battery to your existing inverter will extend the inverter warranty to 10 years. This must be done within 3 months of the original installation for eligibility. If done later than this, the battery will be registered separately at 10 years, and the inverter maintains a 5 year warranty.
