BMS battery management function

Overview

What is battery management system (BMS)?

Battery Management System (BMS) is the “intelligent manager” of modern battery packs, widely used in fields such as electric vehicles, energy storage stations, and consumer electronics.

How do battery management systems work?

Battery management system (BMS) is technology dedicated to the oversight of a battery pack, which is an assembly of battery cells, electrically organized in a row x column matrix configuration to enable delivery of targeted range of voltage and current for a duration of time against expected load scenarios.

What are the components of a battery management system (BMS)?

A typical battery management system (BMS) consists of the following main components: Battery Management Controller (BMC), Voltage and Current Sensors, Temperature Sensors, Balancing Circuit, and Power Supply Unit.

What makes a good battery management system?

They need to handle new challenges while controlling complex battery systems more precisely. A good battery management system (BMS) needs hardware components that work together to monitor, protect, and optimize battery performance. These components act as the system’s eyes and ears.
