

East Asia Base Station Computer Room EMS

Overview

What is delta's environment management system (EMS)?

Delta's Environment Management System (EMS) monitors the environment and conditions in the data center, including temperature, humidity, water leakage, and alarms for fire, smoke, and unauthorized entry. The EMS offers IT managers an integrated platform for more convenient monitoring of today's data center.

What is envirostation EMS & how does it work?

The EMS offers IT managers an integrated platform for more convenient monitoring of today's data center. EnviroStation integrates the monitoring of the data center's environment and other conditions, and sends the data to a central manager via network. User-defined alarms ensure the data center's security.

How do urban radio stations manage power & environmental management?

For urban radio sites, some operators use a multi-layer control system for their power & environmental management. Each city has a power & environmental monitoring system which reports to a higher-level monitoring center.

How does an EMS monitoring system work?

The monitoring system provides an interface to the EMS, through which the EMS collects data; the EMS can then manage alarms and issue work commands in a centralized manner. In this context, operators can make better decisions by understanding both service loads and energy efficiency.

Implementation of Client Interface
 Implementation of Client Real-Time Display Module
 Realization of Real-Time Control Module
 The client data is transmitted through MQTT protocol, and the server provides an API interface for app calling, including user management interface, device module management interface, and historical data recording interface. The user management interface is responsible for user registration and login management. The equipment module management interface is responsible for equipment management.
