Factory price d curve breaker in Nicaragua

Overview

What is a k & d curve breaker?

The ideal application is a circuit with a motor load. The K and D curve breakers are both designed for motor applications where ampacity rises quickly and momentarily during “start-up.” Both curves can “ride through” the momentary inrush of current and prevent nuisance tripping while providing protection to the circuit.

What is a D-trip circuit breaker?

Breakthrough current is the maximum current that the circuit breaker can safely stop in the event of a short circuit. D-trip circuit breakers prevent nuisance tripping, so they are best for equipment that has a high spike in current at startup, such as transformers, power supplies, and heaters.

How many times rated current should a D curve MCB trip?

D curve breakers: Trip between 10-15 times rated current. D curve MCBs should be applied where loads have a high level of in-rush current on start-up. The ideal application is a circuit with a motor load. The K and D curve breakers are both designed for motor applications where ampacity rises quickly and momentarily during “start-up.”

When should a D curve MCB be used?

The ideal application is a circuit with a small transformer load. D curve breakers: Trip between 10-15 times rated current. D curve MCBs should be applied where loads have a high level of in-rush current on start-up. The ideal application is a circuit with a motor load.
