

How to network solar energy on-site

Overview

What is a solar power connection?

It's the physical and electrical point where the electricity produced by the solar panels is fed to the utility grid or used within a building. This connection is essential for integrating solar power into the broader energy infrastructure.

How does a solar project connect to the grid?

Utility-scale projects either connect directly to a substation or a transmission line of 69 kV or higher. Unless a solar farm is installed next to transmission lines or substations, the solar contractor needs to install a generation tie to connect the clean energy project to the grid.

How do I connect a grid-tied solar panel system?

Always refer to the NEC code in effect or consult a licensed electrician for safety and accuracy. There are two basic approaches to connecting a grid-tied solar panel system, as shown in the wiring diagrams below. The most common is a "LOAD SIDE" connection, made AFTER the main breaker.

How do solar farms connect to the grid?

Solar farms connect to the grid by converting the direct current (DC) generated by solar panels into alternating current (AC) through inverters. The AC electricity is then transmitted to a substation within the solar farm, where it is further transformed and connected to the broader electrical grid.
