

Interfere with solar container communication station solar panels

Overview

Are solar panels a problem for communication systems at airports?

Dan et al. reported the conducted emission measurements from a domestic PV plant with Eurenor solar panels of 450 W each and 2 kW inverter. Some researchers have noted that the solar PV installations at airports may also pose problems for communication systems at airports. Main articles or reports in this domain are as follows.

How to avoid interference by PV systems at airports?

To avoid interference by PV systems at airports, the following measures are suggested. The PV installations should be located at least 200–250 ft away from the communication systems. PVI should be avoided where they might cause interference to navigational aids. Radar absorbing material could be used to reduce unwanted signal reflections.

Do solar panels interfere with infrared communications?

Federal Aviation Administration (FAA) guidelines suggest that any interference with radar, navigation aids, or infrared communications should be checked before the solar panels are actually installed. Interference with infrared communications might occur due to increased temperature of the panels in the full sunlight.

Can solar panels reduce the range of communication?

The Swedish Defense Research Agency showed that solar panels co-located with an air traffic control system can reduce the range of communication up to 50% based on the assumption that the PV array's current from 30 MHz to 200 MHz is at the limit of EN55022 class B.
