

Lithium power station factory in France

Overview

Why is France upping lithium production?

After years of deindustrialisation, France is upping lithium production to support battery manufacturing and the green transition. What is France's largest lithium project?

One of the country's largest lithium projects, EMILI, is being developed by French multinational Imerys. The project in Beauvoir, central France, where lithium was first detected in the 1960s, hopes to produce enough lithium per year, over 25 years, to power 700,000 EVs.

Where will France's first lithium plant be located?

Lauterbourg, a commune at the northern tip of Alsace, will be the site of France's first lithium plant. This ambitious initiative, led by Alsace-based Viridian Lithium, aims to reduce France's dependence on imports of this precious metal, essential for the manufacture of batteries for electric vehicles.

Why should France invest in a lithium plant in Lauterbourg?

It also provides fertile ground for the development of the new refinery. The development of this lithium plant in Lauterbourg is an essential component of France's energy transition strategy. By increasing local lithium production, France is strengthening its industrial and energy sovereignty. It also supports the development of electric vehicles.
