

Maximum current for charging and discharging energy storage batteries

Overview

What is the maximum charge/discharge of a battery?

Two 5.12/5.32kWh batteries have a continuous discharge of 100A. This means that the maximum charge/discharge is limited to the 90A of the inverter. Other Current Limiting Factors Your current should also be suitable for the rated current of your battery cables.

What does discharge rate mean on a battery?

The discharge rate indicates how quickly a battery can safely deliver energy. Like the charge rate, it's expressed as a multiple of the battery's capacity. 1C Discharge Rate: Discharging a 2000mAh battery at 2000mA. 2C Discharge Rate: Discharging the same battery at 4000mA.

What percentage of a battery should be discharged?

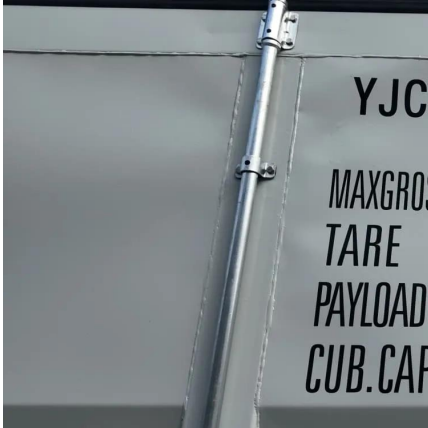

Shallow Discharge: Using only 20–30% of the battery's capacity. Deep Discharge: Using 80–100% of the battery's capacity. Deeper discharges can shorten the battery's lifespan. For example, a battery cycled at 80% DoD may last only 500 cycles, while the same battery cycled at 20% DoD could last 2000 cycles.

Do high discharge rates affect battery life?

High discharge rates are essential for power-hungry devices like drones or RC cars. However, consistently discharging at high rates can reduce the battery's lifespan. Pro Tip: Match the battery's discharge rate to your device's power requirements to avoid overloading the battery.
