# Micro inverter connected to solar panels

## Overview

---

What is a solar panel microinverter?

Unlike centralized string inverters, which are typically responsible for an entire solar panel system, microinverters are installed at the individual solar panel site. Most solar panel systems with microinverters include one microinverter on every panel, but it's not uncommon for one microinverter to connect to a handful of panels.

Do solar panels need microinverters?

Without microinverters, you'd need two string inverters, and you wouldn't be able to monitor every panel. Larger solar panel systems naturally have a higher chance of one of their panels underperforming, so these can particularly benefit from having microinverters.

How do solar microinverters work?

Microinverters are typically installed directly onto each solar panel. This set-up strays away from traditional string inverters that connect multiple solar panels together in series. In practice, each solar microinverter operates independently.

Where should a microinverter sit on a solar panel?

Alternatively, string inverters typically sit more conveniently on the side of your house. Clipping refers to power losses associated with microinverters and is an important consideration when shopping for a solar panel system. Often, the power output rating of your microinverter is lower than that of the panel itself.
