

Models for building energy storage power stations

Overview

What are the development models of pumped storage power stations?

According to the different stages of the development of the power market, this paper puts forward the corresponding development models of pumped storage power stations, which are successively the “two-part price system” model, the “partial capacity fixed compensation” model, and the “completely independent market participation” model.

How can pumped storage power stations be fully independent?

In the model of “completely independent participation in the market”, the technical transformation of the pumped storage power station should be accelerated, the energy conversion efficiency of the power station should be reasonably improved, the power loss should be reduced, and the cost recovery of the power station should be promoted.

What is the operation model of Japan's pumped storage power station?

The operation model of Japan's pumped storage power station mainly includes a leasing system and an internal accounting system. In the lease system, according to the principle of cost-ism, the lease fee is a fixed electricity fee based on the construction fee of the power station.

How to determine the operation strategy of a pumped storage power station?

When formulating the operation strategy of the power station, reference can be made to the operation data reported by the power station for the five years from 2018 to 2022. The power consumption and power generation of the pumped storage power station during this period are shown in Figure 5.
