

# **Operation price of energy storage power station**

## Overview

---

How does the power abandonment cost coefficient affect shared energy storage power stations?

In this way, the cost of abandoning wind and solar power, as well as the total costs, will be affected. Therefore, evaluating how the power abandonment cost coefficient influences the operation of the shared energy storage power station and the allocation of associated costs presents significant importance.

Should shared energy storage power stations be allocated?

This allocation method, although straightforward for the overall system to distribute the costs associated with the shared energy storage power station to each renewable energy power station involved, does not take into account the practical use rates of the shared energy storage services and may appear unjust to stakeholders.

How can shared energy storage assistance improve power system cost evaluation?

These methods improve the precision of power system cost evaluation and enable renewable energy stations to allocate their responsible costs effectively. Furthermore, a combined operational and cost distribution model was formulated for power generation systems utilizing shared energy storage assistance.

How can pumped storage power stations be fully independent?

In the model of “completely independent participation in the market”, the technical transformation of the pumped storage power station should be accelerated, the energy conversion efficiency of the power station should be reasonably improved, the power loss should be reduced, and the cost recovery of the power station should be promoted.
