

Outdoor power consumption

Overview

Do tunable multi-spectral LED displays consume a lot of energy?

Typically, for tunable multi-spectral LED displays, different light colors and luminance correspond to different energy consumption, but the exact relationships are not clear. This study investigates the energy consumption of LED displays under a series of spectral settings.

Why is energy monitoring important for outdoor LED display screens?

To address the energy consumption issue, energy monitoring is of great importance. However, existing energy monitoring methods face challenges in effectively dealing with the dynamic, and multicolored characteristics of outdoor LED display screens .

How do we measure energy consumption in LED displays?

To tackle this issue, we propose an energy monitoring method by mapping the spectral power distribution (SPD) of LED displays and energy consumption. This method accurately reflects the spectral conditions of LED display screens under different colors and relative luminance.

Can LED displays reduce energy consumption in urban commercial districts?

This work provides a convenient and non-destructive method for measuring the energy consumption of LED displays, significantly reducing facility management costs in urban commercial districts with numerous displays, and thereby facilitating a balance between urban development and environmental monitoring.
