

Solar container lithium battery pack balance control

Overview

What is a passive cell balancing system for lithium-ion battery packs?

The presented research actually proposes a novel passive cell balancing system for lithium-ion battery packs. It is the process of ramping down the SOC of the cells to the lowest SOC of the cell, which is present in the group or pack. In simple words, consider a family having 5 members, such as parents and children's.

Is artificial neural network a balancing control strategy for lithium-ion battery packs?

Abstract: This study introduces a balancing control strategy that employs an Artificial Neural Network (ANN) to ensure State of Charge (SOC) balance across lithium-ion (Li-ion) battery packs, consistent with the framework of smart battery packs.

What is the balancing control strategy for sub-module batteries?

To address this technical challenge, this paper innovatively proposes a new balancing control strategy for the SOC of sub-module batteries. This strategy adopts the extreme values of the SOC of all battery units as the reference for balancing control and replaces real-time average calculations with a one-time computation.

How does a battery SoC balancing system work?

At the initial stage of system operation, the extreme values of all battery SOC are selected as the reference values for balancing control, which avoids the need for real-time average calculation, reduces the computational burden, and thus accelerates the speed of battery SOC balancing.
