

# **Solar modules made of class b batteries**

## Overview

---

What is a Grade B solar panel?

Grade B solar panels have visual defects but meet performance specifications. These solar panels are less common than grade A solar panels but are typically available from manufacturers upon request. Most manufacturers keep these panels for testing purposes but sell them with warranties like grade A solar panels.

What is the difference between Grade A and grade B solar cells?

Such modules usually have only a positive tolerance (i.e. the capacity of the modules is always higher than the passport one) and lower temperature coefficients. Grade B solar cells have visual defects and have a lower filling factor of the CVC characteristic: 0.4-0.7. Their price is usually a bit lower than that of the elements of Grade A.

What type of battery should a solar system use?

Lithium-ion batteries are the most common type of battery used in residential solar systems, followed by lithium iron phosphate (LFP) and lead acid. Lithium-ion and LFP batteries last longer, require no maintenance, and boast a deeper depth of discharge (80-100%).

What kind of solar panel is called a Grade?

The grades of solar panels can be divided into A grade, B grade, C grade and D grade, and A grade solar modules can be divided into two grades, A+ and A-. The cost gap is also very large. So what kind of solar panel is called A grade, and what kind of solar panel is called D grade?

Here is a brief introduction for you:
