

# **Solar panel outputs negative current**

## Overview

---

Does a solar panel have a good output voltage?

A problem that a DIY solar power enthusiast may someday face is to find a solar panel [or a whole solar panel array] has good output voltage – but does not produce any power when connected to a charge controller. Video related to this blog post: [Solar Panel makes no power! But has Voltage?](#)

Solar Panel makes NO POWER! but has VOLTAGE?

.

Why do solar panels have different voltages?

However, due to variations in internal resistance, the cell voltage and therefore available current will vary between photovoltaic cells of equivalent size and structure, connected to the same load, and under the same light source so this must be accounted for in the solar panel assemblies you buy.

What is the difference between voltage and current for solar panels?

Maximum Power Voltage ( $V_{mp}$ ): This is the voltage at which your panel operates most efficiently. If voltage is pressure, current (measured in amps) is the flow rate. Voltage is how steep the river is, while current is how much water flows past you each second. Some key points about current for solar panels:.

Why do solar panels use bypass diodes?

This use of bypass diodes in solar panels allows a series (called a string) of connected cells or panels to continue supplying power at a reduced voltage rather than no power at all. Bypass diodes are connected in reverse bias between a solar cells (or panel) positive and negative output terminals and has no effect on its output.
