

# **The difference between single glass and double glass modules 560w**

## Overview

---

What is a double glass solar panel?

Double glass solar panels, also referred to as glass-glass or bifacial panels, are a newer technology in the solar industry. As the name suggests, these panels have glass on both the front and back sides, encapsulating the solar cells between two layers of glass.

Are double-glass solar modules reactive or non-reactive?

Furthermore, comparing to plastic backsheets (the back material of single-glass solar module) which are reactive, glass is non-reactive. This means that the whole structure of Raytech double-glass solar modules (two layers of glass and one layer of solar cells in the middle) are highly resistant to chemical reactions such as corrosion as a whole.

What is the difference between double-glass solar panels and single-sided solar panels?

The main difference between double-glass photovoltaic modules and single-sided glass solar panels lies in their construction and design, which can impact their durability, performance, and applications. Construction: Double-glass modules consist of two layers of glass sandwiching the solar cells and other components.

Are single glass solar panels better than double glass?

Single glass solar panels are affordable and cheaper than double glass solar panels, therefore they are available in the market easily and more in quantity than double glass panels. They also require less materials and time to be manufactured which also causes a production of wide range of single glass panels.
